and may devote his time to his bride. He further alleges that the young couple do not exhibit their affection in public, but that one may conclude from various signs that mutual affection continues even in advanced age. Jealousy, however, often comes into the open, and women are particularly suspicious of their husbands. The usual factors leading to the disruption of a marriage are cited as disagreement over the upbringing of the children, idleness of either party, the disputatious nature of the women, or the irascibility of the men.

Sexual relations are maintained during menstruation; Schebesta mentions the fact that the only restriction is during the final stage of pregnancy and for several months following childbirth. In some regions, he adds, there is also a restriction on sexual intercourse between the husband and any woman following the birth of a child to his wife. Such a statement evidently implies an acceptance of extramarital intercourse in other regions, yet he also claims that adultery is considered as a moral transgression offending the divinity; when committed with a married woman, it is criminal. Some allowance is made for a man who cannot have relations with his wife (as during a period of sex taboo); intercourse with an unmarried woman is then generally not considered as adultery. An itching body and birth of twins are, among some

533 four types of song can be distinguished by its musical form alone, but its performance is not necessarily limited to the appropriate occasion. Thus a *molimo* song may be sung around the campfire in the evening without the *molimo* association's necessarily holding a formal meeting, which would exclude the presence of women. Similarly, honey-gathering songs may be sung well out of honey season. A fifth group, play songs, is associated with children's games and mothers' lullabies.

512 Singing, dancing, and story telling may continue late into the night unless it is raining. Families retire to their huts as they feel inclined, but throughout the night there is nearly always a small group of men or boys around the main fire, warming themselves or smoking. This is where the bachelors generally sleep.

• 84 184 CONCEPTION AND CHILDBIRTH

The general information given by Schebesta for the archers applies to the net hunters also.

845 Putnam has, however, recorded a number of difficult births, and Mrs. Putnam witnessed various measures taken to overcome complications. On one occasion a Pygmy woman was in labor for 36 hours in a village. Villager and Pygmy women came and tried their own individual remedies, including filling the ears and

as being masters, and their help is constantly being sought by villagers, not so well versed in forest lore. It has been shown, however, that where the Mbuti see a remedy that is more effective than theirs, such as modern drugs (only in some cases are these apparently superior), they will eventually seek them. Insofar as local dispensaries were run by villagers, the Mbuti had to rely on the villagers for such drugs. I do not consider this an instance of dependence, however, as up to the end of my last field trip the Mbuti would only seek such help when they were in the village; in the forest they found their own remedies adequate. Even more, when sickness or injury befell them in the village, the common reaction was to return to the forest.

But here we may note a significant difference in attitude to magic, or curative activity. Childbirth is a time which is thought of by both Mbuti and villagers as being attended by the possibility of danger, at least. The Mbuti think in terms of physical danger, and they have precautions that they take in the diet and behavior of the expectant mother before birth, and apparently effective knowledge of midwifery, including recognized ways of dealing with difficult births. After birth there are known cures for any weakness the infant or mother might show. What is lacking, among the Mbuti, is precisely what is dominant among the villagers: a felt need for protection against the supernatural.

A village mother and child will both have, according to how wealthy the family is, a number of potions to drink (which may or may not have medical significance, but are thought of as being protective) and divers charms to wear. The protection is thought to be necessary against unknown dangers. The difference between the two peoples is in the extent of this unknown. An Mbuti infant will have a vine bracelet or belt tied to it almost immediately after birth, and a small piece of wood or two will be fixed to the vine. It is stated that the vine and the wood convey to the child the health and strength of the forest. There is no apparent concern for any supernatural dangers, and no precautionary steps taken.

From the village point of view the lack of such measures involves the child and possibly the mother in great danger, and out of self-concern as much as out of concern for the Mbuti, the villagers proffer charms in abundance to expectant mothers and newborn children. However, the need is only felt by the villagers, not by the Mbuti.

This is precisely the difference we find when we seek other situations for which only the villagers have a cure—they are situations in
